Abstracts

The objective lenses are the optical elements closest to the specimen in microscopy. The objective lens gathers light from the specimen, which is focused to produce the real image that is seen on the ocular lens. Objective lenses are the most complex part of the microscope due to their multi-element design. It is this complexity that makes the objectives the most important components of microscopy. Life science refers to the study of living organisms including, microbes, human beings, animals, fungi, and plants. In life sciences, the need for objective lens that has high resolution and are small in size and also have a good working distance from what is being imaging is a major challenge.
