Abstracts

Microscope immersion oil helps produce high-magnification images with fine focus while using objective lenses that have a high numerical aperture. With the increase in magnification comes a decrease in the objective lens's working distance and focal length. This decrease means that, with very little space to pass between the glass coverslip and the front lens of the objective, the light often has reflections that distort the image. But, liquids have a higher refractive index than air, so immersion oils help to narrowly channel the rays of light into your light microscope.
