Abstracts

Currently, the global oil & gas sector uses technology that enhances recovery processes; helps initiate the desulfurization and denitrification of oil; and helps in the control of the two processes by microorganisms. In oilfield activities and, essentially, during drilling and oil recovery, microorganisms can cause a severe impact on the oil recovery process through corrosion of equipment and piping systems and formation of bio-films on walls of storage tanks, piping systems, filters, and valves. Microorganisms can plug the flow and cause degradation of oilfield chemicals being used. In order to kill microorganisms, biocides are employed.
