## Abstracts

Optoelectronic or Photonics packaging requires extremely accurate placement of components to ensure appropriate suitable alignment and coupling of light into and out of devices. In many cases the generation or detection of light results in significant heat being generated, which if not suitably dissipated through appropriate joining technology and material selection, can adversely affect the device operation. Additionally, assembly processes can be complicated by the requirement that fluxes and other organic materials can't be used as they can degrade the performance of facets in optical devices.
