Abstracts

Catalyst is a substance that increases the speed of a chemical reaction without getting consumed in it. Organic catalyst are the compounds that predominately consist of organic molecules of C, H, O, N, S and P to accelerate the rate of a chemical reaction. Organic catalyst is also known as organocatalyst and the process of increasing the rate of a chemical reaction is referred as organocatalysis. Owing to the advantages such as lack of sensitivity to oxygen and moisture, easy reaction manipulation, low toxicity, low cost and their ready availability, Organic catalyst are preferred in the pharmaceutical and agricultural sector as the materials of choice over other transition metal catalyst. Furthermore, organocatalyst are compatible with several functional group and does not require anhydrous condition, thus reducing the number of reaction steps and the cost of synthesis. Metal organic catalyst consist metal linked to the organic catalyst and since these metals can causing health issues if used for medicinal purposes, thereby manufacturers are using organic chemical catalyst for biological catalysis and moving towards adopting the principles of green chemistry.
