## Abstracts

Lecithin is one of those mysterious, but common, ingredients found on the label of many packaged foods. It's an essential emulsifier that helps blend ingredients that don't naturally mix. Due to the lack of adequate organic sources of soy lecithin, the USDA allowed the use of non-organic sources when it drafted the national organic standards in 2002.

To be labeled 'ORGANIC,' and to carry the USDA organic seal, food has to be made up of 95% organic ingredients. The only non-organic ingredients are ones that are unavailable organically and cannot make up more than 5% of the product. NOP rules allow the use of 5% non-organic ingredients if sufficient quantities of organic alternatives are not available. At present, 100% and 95% organic soy lecithin are common types.

The Commission Implementing Regulation (EU)2016/673 determined that "Lecithin derived from organic raw material is available on the market, but appropriate qualities of such lecithin are needed for most of the uses in the organic food processing industry. The appropriate qualities for the organic food production are currently not available in sufficient quantities. Taking account of the temporary lack of the different qualities of the organic lecithin needed for the organic production of food, it should be provided that during a transitional period of 3 years lecithin not derived from organic raw material may be used in the production of organic food".
