Abstracts

An orphan drug is a drug used to treat a disease that cannot be produced profitably without government assistance because of the small number of patients. The classification of certain diseases, and the medicines that treat them, as 'orphan' is a matter of public policy in many countries. Given the nature of the enormous economic resources required for medical research, these medicines would have no chance of producing breakthroughs that otherwise might not have been possible without government assistance. In the United States and the European Union, orphan drugs are easier to obtain marketing authorization. There may also be additional financial incentives, such as an extension of the market exclusivity period, which would allow the pharmaceutical company to have a longer exclusivity to sell the drug. All of these measures are designed to encourage drug development, and without this kind of profit motive, few pharmaceutical companies will be willing to allocate their budgets and personnel to this type of research.
