Abstracts

Pad printing is an indirect photogravure process to transfer a 2D image upon a 3D object. Depressions are etched into a flat plate. These depressions are filled with ink and a smooth silicone pad (silicone is ink repellent) is used to pick up some ink on the plate and transfers it to the object. This stamp is called pad and gave this printing process its name. Pad Printing is used for printing on difficult-to-print on products in many industries including automotive, medical, apparel, and electronic objects, as well as electronic appliances, toys and sports.
