Abstracts

The term transmission often only refers to the gearbox that uses gears and gear trains to provide speed and torque conversions from a rotating power source to another device. A transmission has multiple gear ratios with the ability to switch between them as speed varies. This switching may be done manually by the driver or automatically. Directional (forward and reverse) control may also be provided. Single-ratio transmissions also exist, which simply change the speed and torque (and sometimes direction) of motor output. Transmission fluid is a slippery liquid that acts as a lubricant for all of the moving parts inside transmission.
