Abstracts

A lateral transfer is shifting a patient from surface to surface, such as bed to hospital cart, bed to bed, and others. This shifting of patients was carried out by staff members which creates a risk of injury to the healthcare workers' shoulders and lower back. Hence, use of patient lateral transfer devices such as roller boards, repositioning sheets with use of a ceiling lift, friction-reducing sheets, and air transfer devices decreases the force to complete a lateral transfer which results in less number of musculoskeletal injuries in caregivers.
