In the printed circuit board, copper is used to interconnect components on a substrate , although it is to form a conductive path printed circuit board graphics board good conductor material , but if prolonged exposure to air , but also it is easy to lose luster due to oxidation , corrosion and loss suffered due weldability . Therefore, you must use a variety of techniques to protect the copper traces , vias , and plated through holes , such techniques include the organic coating, the oxide film and plating techniques .

Metal plating or coating process is to ensure weldability and corrosion protection circuit to avoid the standard operation, the circuit board manufacturing plays an important role in the single-sided , double-sided and multilayer printed . In particular, the plating layer having a printed line of the weld metal has become a solder protective layer provided for the operation of a standard copper tracks .

Development occurs in electroplating , through the development of automated computer -controlled plating equipment , conduct chemical analysis of organic and metallic additives in highly complex instrument technology, and precise control of the chemical reaction process technology, electroplating technology to achieve a high level.
