PE-RT (Polyethylene of Raised Temperature resistance) for hot and cold water as well as industrial pipe applications. These materials have a unique molecular structure and crystalline microstructure, which provides excellent Long Term Hydrostatic Strength at high temperatures without the need for cross-linking the material. PE-RT type materials have been used successfully in domestic hot and cold water piping systems for more than 20 years, and in application areas such as underfloor heating and radiator connections. More recently, the easy processing and outstanding material properties have also made these resins attractive for use in many larger diameter industrial applications, where regular Polyethylene cannot be used due to its high temperature limitations. In this respect PE-RT can also compete with high-end engineering plastics, offering significant cost savings. The use of PERT materials provides significant process advantages to the converters, allowing high line speed pipe production and providing excellent flexibility and ease of installation for the application.
