Abstracts

Pericarditis is the inflammation of the pericardium. Pericardium is two thin layers of a sac like structure of tissues that surrounds the heart. The pericardium holds the heart in place and helps it work. It is a small amount of fluid that keeps both the layers separated from each other so that there is no friction between the layers. Pericarditis often causes chest pain and other symptoms too. The harsh chest pain associated with pericardium occurs when the layers of the pericardium rub against each other. Pericarditis usually begins suddenly but does not last for long. When symptoms related to pericarditis develops more gradually or persists, it is considered as chronic pericarditis. Most cases of pericarditis are mild and usually improve on their own. The common symptoms related to pericarditis include cough; leg or abdominal swelling; low-grade fever; heart palpitations; shortness of breath when reclining; an overall sense of weakness, feeling sick or fatigue; and sharp, piercing chest pain. Pericarditis can be diagnosed with the help of electrocardiogram results, echocardiogram, physical examination, cardiac MRI, and reported symptoms.
