## Abstracts

Composite copper foil is to first use vacuum deposition of copper on the surface of plastic film with a thickness of 4~6 microns to make a metal layer of about 50-80 nanometers, metallize the film, and then use aqueous medium electroplating to deposit copper layer. Thickened to 1 micron, the overall thickness of the composite copper foil is between 5 and 8 microns, instead of the traditional electrolytic copper foil. The PET composite copper foil can save about 2/3 of the copper, which can significantly reduce the material cost.
