## Abstracts

A peripherally inserted central catheter or PICC is a thin, long tube that's inserted via a vein in the arm and passed in through to larger veins that reside near the heart. Also known as PICC line, they are usually placed in the arm and, in rare cases, in the leg. The purpose of a peripherally inserted central catheter is to deliver liquid nutrition or medication to the central veins near the heart. A PICC line gives the doctor access to the large veins near the heart. The benefit of using PICC is that it helps in avoiding the pain of needle sticks and also reduce irritation of smaller veins. Other than PICC lines, there are other types of central venous catheters like central lines and implantable ports. Peripherally inserted central catheters are commonly used for cancer treatment, liquid nutrition delivery (total parenteral nutrition), infection treatment (antifungal medicines & antibiotics delivery), and other medications.
