A microgrid is a group of interconnected loads and distributed energy resources (DERs) with clearly defined electrical boundaries that acts as a single, controllable entity with respect to the grid. A microgrid can connect and disconnect from the grid to enable its operations in both grid-connected or islanded mode. The modular energy platform makes components in the microgrid network (comprising energy capture, transfer, storage, and distribution) “smart.” This means each node in the network can “think” (they can process computing tasks with in-built microchips) and “talk” with other nodes (they can transfer data through the internet).
