Abstracts

The silicon photonics module is based on silicon photonics integration technology and uses industry-leading chips. It changes the layout of traditional discrete devices and greatly simplifies the design and manufacture of optical modules, which are mainly used in data center networks to increase the bandwidth from 100G to 400G. Silicon photonics technology will eventually move towards photoelectric integration (OEIC: Opto-Electric Integrated Circuits), making the current split photoelectric conversion (optical module) into a local photoelectric conversion in photoelectric integration, and further promoting the integration of the system.
