Immunoglobulin Y (abbreviated as IgY) is a type of immunoglobulin which is the major antibody in bird, reptile, and lungfish blood. It is also found in high concentrations in chicken egg yolk. As with the other immunoglobulins, IgY is a class of proteins which are formed by the immune system in reaction to certain foreign substances, and specifically recognize them.

IgY antibodies have a different structure from IgG, particularly in the Fc and hinge regions. The affinity maturation process of IgY is also different from IgG. These biological features underlie IgY's competitive advantages over IgG. Shown in the four panels are several comparisons between IgY and IgG.
