Abstracts

The PCR (polymerase chain reaction) sequencer can amplify bacterial DNA up to 1,000 times. Any routine diagnosis requires a minimum of 10 to 80 bacteria, which means that PCR is highly sensitive. This factor has been used in countless diagnostic procedures. PCR (polymerase chain reaction) sequencing machines do not yet need to purify bacterial samples because they have specific sequences that identify bacterial DNA. The versatility of PCR has proven to be a great advantage, and the diagnosis of many dangerous diseases (such as tuberculosis, pneumonia, etc.) is aimed at determining whether the strain is resistant. This greatly improves the success rate of treatment.
