## Abstracts

Polyvinyl ethers (PVE) are either viscous oils or soft and tacky rubbery materials depending on the chemical composition and molecular weight. Their glass transition temperature is well below room temperature. They are known for their elasticity and excellent resistance to hydrolysis (being ether-based, PVEs do not hydrolyze). They also have fairly good weatherability and heat resistance since they do not have double bonds in the backbone and are miscible with water and soluble in many solvents. They are usually none hazardous substances and not irritants to skin.
