DE is made from Diatomites, which are rough, porous fossilized mineral deposits formed near dried up water. The mineral is a result of dead single-celled algae called diatoms usually found in marine sediments. Diatoms account for ? of all photosynthesis on Earth. The size of each diatom is about the width of a human hair (0.5 mm). While some diatoms float by themselves, many diatoms group together and form suspended chains near the surface of water or attach themselves to rocks or plants under water.
