Abstracts

Portable air conditioners are a device to modify the condition of air (heating, cooling, but mainly cooling). Perfect for a variety of cooling situations, portable air conditioners are great alternatives to traditional air conditioning systems because they're compact, mobile, and require no permanent installation. Moreover, because they're usually used to cool only certain parts of a home or as a supplement to central air conditioners, they can be much more cost-effective to run. Portable air conditioners use refrigerants to reduce the temperature. During the cooling process, moisture is condensed out of the air and collected in a drain bucket or exhausted out through a drain hose or evaporated out the exhaust. The heating system uses PTC heating technology, fast heat transfer, high efficiency, and low power consumption.
