Abstracts

The odor scanner is a novel instrument developed in the 1990s for rapid detection of food. It quickly provides overall information about the sample under test with specific sensors and pattern recognition systems, indicating the hidden characteristics of the sample. The electronic tongue is a sensitive membrane that uses materials similar to biological systems as sensors. When one side of the lipid membrane is in contact with a taste substance, the membrane potential changes, resulting in a response to detect the relationship between various substances. . This taste sensor has high sensitivity, reliability and repeatability. It can quantify the sample, and at the same time, it can measure the content of some components by laboratory or public inspection, which becomes difficult to obtain and do not show.
