Abstracts

The preheating furnace is a kind of low-quality fuel (mainly refers to low-calorific fuel such as blast furnace gas, hot gas, and exhaust gas) or air. The temperature increases, usually to 300-900 degrees. Therefore, the actual combustion temperature of the inferior fuel or the sensible heat of the air is increased, and high-temperature calcination or other processes of the inferior fuel are achieved, thereby replacing the superior fuel.
