Abstracts

Primary immunodeficiencies are a group of different disorders in which part of the body's immune system (mainly cells and proteins) is missing or does not function normally. As per researchers, estimated more than 300 different kinds of primary immunodeficiency disease (PIDD). The immune system is composed of white blood cells made in the bone marrow which protect and defend against attacks by foreign invaders such as bacteria, fungi, and germs. Antibodies and Complement are proteins that are made in response to infection or immunization and helps to fight against infections and plays a protective role in the immune system. In the most common primary immunodeficiency diseases, different forms of cells or proteins are missing or do not function which results in severe infections and/or infections that are unusually hard to cure. These infections may attack the respiratory system, the brain or spinal cord, the ears, skin, or in the urinary or gastrointestinal tracts. In some instances, primary immunodeficiency diseases target specific and/or multiple organs, glands, cells, and tissues. For example, heart defects are present in some primary immunodeficiency diseases.
