## Abstracts

The proportional control valve is a hydraulic control valve that can make the output oil parameters (pressure, flow and direction) proportional to the changes in the input electrical signal parameters (current, voltage), so as to achieve continuous proportional control. It is a new type of hydraulic control element that integrates the advantages of switch-type electro-hydraulic control elements and servo-type electro-hydraulic control elements. This kind of valve can be controlled in an open loop or by adding a feedback link to form a closed loop control. It has good static performance and dynamic performance that can meet the requirements of general industrial control.
