Abstracts

The application of pulsed electric field ablation technology is based on the electroporation effect of pulsed electric field. Electroporation is divided into reversible electroporation and irreversible electroporation. Reversible electroporation refers to the temporary hydrophobicity or hydrophilicity of the cell membrane under a certain electric field strength. After the electric field disappeared, the cells returned to their natural state. Irreversible electroporation refers to a stronger electric field that causes the cell membrane to permanently permeate and cause cell death.
