Abstracts

Pushback Racking is a gravity flow racking system that stores pallets on wheeled carts nesting on inclined storage rails. Each pallet requires its own cart which will move up and down angled rails when pallets are loaded or unloaded from the system.

When a product is loaded into a push back racking system, a pallet is placed onto a cart and pushes the pallet at the pick face back one position. This allows the next cart to become available with the last pallet resting on the rails. This creates a last-in, first-out storage system. During unloading, the pallet in the front position is removed and acts as a brake for the next cart which glides to the front position for picking.
