Radial head replacement surgery is undertaken on a patient's elbow following a complex fracture to the radial head where fixation by means other than with screws or a plate is not suitable or feasible. During surgery, the fractured bone and joint surface of the radius is removed and replaced with an artificial implant.

Radial head prosthesis is a suitable option for fractures of the radial head that cannot be reduced or synthesized or in cases of malunion with secondary arthritis in the outcomes of conservative or surgical treatment of fractures.
