Abstracts

Radiation Treatment Planning Solutions plan for each beam line route for how the therapy system will deliver radiation. Radiation Treatment Planning Solutions also computes the expected dose distribution in the patient's tissue, including variables such as tissue energy level penetration influences by the type of tissue the beam lines encounter (such as bone, lung and muscle). These systems also help navigate beam placement based on avoiding critical structures that are more sensitive to radiation in an effort to reduce collateral damage from the therapy. This may include automated, complex programming for multi-leaf collimator (MLC) leaf sequencing to shape the beam around critical structures during dose delivery. These treatment plans can also be modified to compensate for the reduction in tumor size over the course of treatments.
