Abstracts

The main purpose of the optical amplifier is to directly amplify the optical signal in the optical fiber communication to compensate the transmission loss of the optical link, so as to realize the all-optical relay long-distance and high-speed transmission in the optical fiber communication system, and reduce the unit bandwidth in the optical transmission. transmission cost. Optical amplifiers enable large-capacity, high-speed, long-distance optical fiber communication, and are an indispensable and important device for all-optical networks. A Raman optical amplifier is an optical amplifier based on Raman gain, which is the result of the stimulated Raman scattering effect.
