Abstracts

Radiosondes are battery-powered telemetry instrument packages that are carried into the atmosphere typically by a weather balloon; they measure altitude, pressure, temperature, relative humidity, wind (both speed and direction), and cosmic ray readings at high altitudes. A class of radiosonde whose position is tracked as it ascends in the atmosphere to give wind speed and direction is referred to as rawinsonde, which is an abbreviation for radar wind sonde. Another class of radiosondes are the ones that are released from airplanes and fall rather than being carried by weather balloons. This class of radiosondes are referred to as dropsondes. Radiosondes play a vital part in most forms of operational atmospheric data assimilation.
