Abstracts

RT-PCR relies on the sequence-specific detection of a desired PCR product. This probe has characteristic fluorescence in the ultraviolet and visible-near infrared region, and its fluorescence properties (excitation and emission wavelength, intensity, lifetime, polarization, etc.) can be sensitively changed according to the nature of the environment, such as polarity, refractive index, viscosity, etc. This probe is able to

interact with nucleic acids (DNA or RNA), proteins, or other macromolecular structures that change one or more fluorescent properties. Thus it could be used to study the properties and behavior of macromolecular substances
