Abstracts

Coagulation factor is the main drug for the treatment of hemophilia, and it has experienced the evolution and development from the first generation blood-derived coagulation factor products to the second generation recombinant products and the third generation long-acting recombinant products. Recombinant coagulation factors avoid the possibility of human infection and get rid of the dependence on plasma; long-acting products improve patient compliance and treatment convenience by prolonging the half-life of drugs, and long-acting recombinant coagulation factors are the trend of future research and development.
