## Abstracts

Oxidation reduction, or redox reactions, involves the transfer of an electron from a donor to an acceptor. The donor loses an electron to change from the reduced to oxidized form and the acceptor gains an electron to change from reduced to oxidized form. The reduced and oxidized forms of a redox component are known as a redox couple.

Redox electrodes are sensitive measurement sensors with a life span based on the chemical and temperature conditions. These electrodes have a typical life span of 2 to 3 years but may vary if the electrodes are subjected to harsh conditions.
