Abstracts

In computing, the term remote desktop software refers to a software or operating system feature that allows a personal computer's desktop environment to be run remotely on one system (usually a PC, but the concept applies equally to a server), while being displayed on a separate client device. Remote desktop applications have varying features. Some allow attaching to an existing user's session (i.e., a running desktop) and 'remote controlling', either displaying the remote control session or blanking the screen. Taking over a desktop remotely is a form of remote administration.
