The environment-friendly Remote Plasma Source (Remote Plasma Generator) to improve the productivity of semiconductor and LCD manufacturing is a product generating high-density plasma that supplies F (fluorine) radicals to clean chemically the Si (silicone) accumulated in the chamber after the deposition process in a semiconductor and LCD manufacturing process. In the chamber to execute a deposition process, it is inevitable that Si powder is accumulated on the inner surface of the chamber as a process is executed, so the current chamber cleaning technology uses a technology to etch it by supplying a lot of active fluorine radicals through remote plasma with the chamber vacuum maintained. The Remote Plasma cleaning method can clean quickly membranes without damaging chambers because the plasma generator generates plasma indirectly separately from the chamber, and generate high-density plasma improved 100?1000 times compared to the existing ones through a plasma generator combined with a power system of high output, high efficiency and 400kHz high frequency and a plasma source of high density using ferrite cores.
