## Abstracts

Rotary diesel UPS systems, also referred to as dynamic UPS or no-break systems, provide uninterrupted, continuous and conditioned power supply. They protect your critical processes against power failures and actively filter out any impurities from the power supplied by the network (power surges or dips, harmonics, transients, brownouts, etc.)

Unlike static UPS systems with batteries, a dynamic UPS consists of (1) a diesel engine, (2) a freewheel, (3) inductive coupling and (4) a generator, where the entire unit is mounted on a frame.

Under normal conditions – i.e. when there is power from the network - the dynamic UPS acts as an active filter against impurities from the network. If the normal power supply fails or is disturbed, the dynamic UPS takes over the task of supplying power - with no interruption, without you noticing any difference, for varying periods of time, and for as long as there is enough fuel.

They are being moving Ups and used in high power situations. Dynamic ups work with alternator groups. While working with kinetic energy in the past, nowadays with developing technology it started to work also with static energies too. Nowadays more and more dynamic UPSs are being used.
