Abstracts

A route-based vibration analyzer, also known as a condition monitoring system, is a system used to measure vibration data of industrial machinery to provide safety in the workplace. Mainly used in manufacturing plants and industrial infrastructure for regular monitoring and tracking. Route-based vibration analyzers collect data weekly, monthly, quarterly or annually depending on plant type and machine type. The vibration data collected from the machines can be used for system repairs and scheduling maintenance processes to avoid major industrial accidents and identify problems before machine failures occur.
