Abstracts

Container runtime solutions enable container usage by providing APIs and abstracting technical components. They facilitate the execution of container lifecycle commands against each container instance. Runtime environments couple the configuration files with the actual files that are necessary to execute the application. Companies use these tools to launch applications and manage the container application lifecycles. With container runtimes specifications, companies can specify how file systems are unpacked, built, and configured. They allow developers to reduce system overhead, share resources, and enforce access capabilities.
