A satellite ground equipment is a terrestrial radio station designed to provide a connecting path for telecommunication of spacecraft with the end-user devices. Ground stations are established on the earth's surface and these communicate with the satellites in real-time by transmitting and receiving radio frequency waves. The ground station includes several elements such as antenna system, telemetry, tracking and command (TT&C) equipment, control center, RF equipment, and gateways.

The establishment of a satellite ground equipment depends upon multiple aspects such as application of satellite, coverage, orbital path, data rate, cost, and accessibility, among other factors. Apart from these ground stations, there exists customer equipment which communicate directly with satellites or through gateways of ground stations. These customer equipment are used at consumer's end and constitute a huge portion of global space ground station equipment market.
