Abstracts

With growth and development of new recycling techniques, some sources of the scrap gold, which were uneconomical for recycling, became viable. For example, electronic components, microchips and printed circuit boards, all contain gold in very small quantities, generally in the form of a fine gold plating some 1 tenth of a micron thick. However, as the quantity of dumped computers, TV sets, cell phones and other electronic circuitry is growing considerably, it makes sense to build recycling installations, which will make the recovery of precious metals economically viable.
