Abstracts

The most common material for selective laser sintering is nylon, a highly capable engineering thermoplastic for both functional prototyping and end-use production. Nylon is ideal for complex assemblies and durable parts with high environmental stability. SLS 3D printed nylon parts are strong, stiff, sturdy, and durable. The final parts are impact-resistant and can endure repeated wear and tear. Nylon is resistant to UV, light, heat, moisture, solvents, temperature, and water. 3D printed nylon parts can also be biocompatible and not sensitizing, which means that they are ready to wear and safe to use in many contexts. Nylon is a synthetic thermoplastic polymer that belongs to the family of polyamides. It is available in multiple variants, each tailored to different applications. Nylon 12 is the most popular general use powder for SLS 3D printing that offers versatility and enables a broad range of applications. Nylon 12 GF is a glass-filled composite material with enhanced stiffness and thermal stability for demanding industrial environments. Nylon 11 helps fill the gap for prototyping and end-use applications that require higher ductility, impact-resistance, and the ability to withstand wear and tear without brittle failure.
