Abstracts

Self-expanding metallic stents are cylindrical in shape and are designed in a variety of diameters and lengths. They usually consist of cross-hatched, braided, or interconnected metal rows that are assembled into tubular structures. The SEMS, when uninflated, are small enough to pass through the channel of an endoscope for delivery of therapeutic endoscopy devices. They reach the lesion through a crimp-type delivery catheter, self-expand to allow blood flow and support the lesion after release, and are then expanded by a deployment device placed at the end of the SEMS and fixed to the wall of the lumen surface by frictional force superior
