Abstracts

Semaglutide (trade names Rybelsus, Ozempic) is a medication for the treatment of type 2 diabetes. Side effects include medullary thyroid cancer, kidney problems, diabetic retinopathy, allergic reactions, low blood sugar, and pancreatitis. Semaglutide acts like human glucagon-like peptide-1 (GLP-1) so that it increases insulin secretion, thereby increasing sugar metabolism. It is distributed as a metered subcutaneous injection in a prefilled pen. One of its advantages over other antidiabetic drugs is that it has a long duration of action, thus, only once-a-week injection is sufficient. An injection version was approved in 2017 in the United States, and in Europe, Canada, and Japan in 2018. An version which is taken by mouth was approved in 2019 in the United States. It is the first glucagon-like peptide (GLP-1) receptor protein treatment approved for use in the United States that does not need to be injected. It was developed by the Danish company Novo Nordisk.
