Abstracts

Semantic knowledge maps include related terms used to discover domains, explaining multiple meanings of similar phrases, facilitating semantic search by extending user queries to relevant keywords/phrases, and identifying trending topics in time series data. It can also build recommendation engines based on content, clean up data by scoring each item according to its relevance, summarize documents by judging the importance of each phrase and entity in the document, and perform predictive analysis of temporal data. The goal is to automatically extract and present domain-specific knowledge from a set of documents that represents the domain. This representation encodes semantic relationships between different words, phrases, and concepts so that these relationships can expose new information about the interrelationships between all entities in the domain, providing a useful reality for the acceptor. Knowledge maps are more accurate, more accessible and more valuable than simple biological maps. It brings together everything one person has written and done to understand the customer and market place better, and semantic technology is most important in the idea of deep linking.
