## Abstracts

Purification capabilities play an increasingly critical role in semiconductor manufacturing as shrinking geometries and multi-layering are significantly increasing gas consumption per processed wafer.

Gas purifier is used to clean gases, reducing the risks of column damage, sensitivity loss, and instrument downtime. Inserting a Gas Clean Filter System in the gas line immediately before the instrument inlet greatly reduces the level of impurities that can lead to defects on the Deposition.

This report focuses on the gas purifiers for semiconductors, key applications include Deposition (MOCVD, PVD, CVD, Epitaxy, ALD) are the largest application, with a share about 45%, followed by Photolithography, etching (wet etch, dry etching), and other applications (wafer growing, diffusion and oxidation processes, stocker cleaning and purging, FOUP Cleaning and purging, etc.).
