Semiconductor packaging is conducted to guarantee protection to the wafer or substrate. The packaging is built from materials such as plastic, metal, glass or ceramic and is composed of one or more semiconductor electronic components.

Semiconductor packaging materials are base players of discrete semiconductor devices and integrated circuits on which other layers are deposited to complete the circuit. Thinner core materials are ideally used to surro system applications.

The validation of lead substrates has increased in comparison to lead frames and bonding wires as the industry advances more towards leadless and cable-less packages.

The market will experience robust growth due to increased demand for smart mobile devices and electronic goods.
