Abstracts

Shoulder replacement is a surgical procedure that substitutes the damaged parts of the shoulder joint with implants and is done to ease pain and improve shoulder function. The damaged region is removed and replaced with artificial components, called a prosthesis. There are two common types of shoulder replacement- Primary Total Shoulder Replacement and Reverse Total Shoulder Replacement. At present, patients who do not find relief from nonsurgical treatments like medications and activity changes are considered for joint replacement surgery. It is a safe and effective procedure to relieve pain and help one resume everyday activities. Shoulder arthroplasty has become the established treatment for severe gleno-humeral disease from rheumatoid arthritis (RA) and osteoarthritis (OA), severe fracture, avascular necrosis (AVN), and cuff-tear arthropathy.
