Abstracts

The silicon parts for etching include silicon rings and silicon electrodes, and are mainly used on 8-12 inches (ie 200mm-300mm) plasma etcher. In the manufacturing process of integrated circuits, high-purity silicon components and wafers are made of silicon material, which makes the electrical properties of etching more uniform, so silicon component products are widely used in semiconductor etching machines. The periodic consumption of silicon components has become an important component consumable in the wafer processing process, which directly affects the electrical properties of the wafer. For example, a silicon ring needs to be replaced after processing about 200 wafers.
